Latvia – Lithuania

Urban greenery adaptation solutions and tools

Online seminar «On the Way to More Resilient and Climate-Adaptive Urban Green Spaces in
Latvia and Lithuania», 14 May 2026

Aiga Spāģe, Natalija Ņitavska, LBTU

This material has been produced within the Interreg VI-A Latvia–Lithuania Programme 2021–2027 project “Enhancing Urban Resilience through Climate-Adaptive Green Space Planning in Latvia and Lithuania” UrbanGreenAdapt (LL-00273) with the financial support of the European Union. Its contents are the sole responsibility of Latvia University of Life Sciences and Technologies and Lietuvos inžinerijos kolegija Higher Education Institution and do not necessarily reflect the views of the European Union.

Presentation content

1. Planning of climate adaptive plantings in the context of urban green infrastructure
2. Principles of climate-adaptive planting design – drought resilient, native and functional species
3. Nature-based solutions for heat mitigation – cool islands, shaded corridors and microclimate regulation
4. Climate Tree Initiative
5. Examples

Planning of climate-adaptive plantings in the context of urban green infrastructure

Why climate-adaptive planting is important

- Cities are increasingly affected by heat waves, droughts, flooding, and biodiversity loss
- Urban green infrastructure helps improve climate resilience and environmental quality
- Climate-adaptive planting combines ecological, functional, and aesthetic values

Why climate-adaptive planting is important

Cities are increasingly affected by heat waves, droughts, flooding, and biodiversity loss

- Rising temperatures intensify heat island effects
- Changing precipitation patterns lead to droughts and heavy rain events
- Habitat loss and biodiversity decline threaten urban ecosystems
- Green spaces must be designed to withstand and adapt to these challenges

Urban green infrastructure helps improve climate resilience and environmental quality

- Trees and vegetation cool the city and improve air quality
- Green areas manage stormwater and reduce flood risks
- Healthy soils and plants store carbon and support ecosystems
- Well-designed green infrastructure strengthens resilient and liveable cities

Climate-adaptive planting combines ecological, functional, and aesthetic values

- Native and climate-resilient plants support biodiversity
- Functional plantings provide shade, comfort, and ecosystem services
- Diverse and beautiful landscapes enhance well-being and place identity
- Sustainable choices create long-term value for people and nature

Climate resilience

Environmental quality

Biodiversity

Well-being

Liveable cities

Planning of climate-adaptive plantings in the context of urban green infrastructure

Main objectives

- Reduce Urban Heat Island effects
- Improve stormwater management and infiltration
- Increase biodiversity and ecological connectivity
- Create healthier and more comfortable public spaces
- Reduce long-term maintenance and irrigation needs

Planning of climate-adaptive plantings in the context of urban green infrastructure

Key planning principles

- Use drought-resilient and climate-tolerant species
- Prioritize native and ecologically adapted plants
- Select plants according to soil, moisture, and microclimate conditions
- Combine trees, shrubs, perennials, and meadow vegetation for multifunctionality

KEY PLANNING PRINCIPLES

for climate-adaptive plantings

Use drought-resilient and climate-tolerant species

Choose plants adapted to changing climate conditions and water scarcity.

Prioritize native and ecologically adapted plants

Native species are adapted to local ecosystems and support biodiversity.

Select plants according to soil, moisture, and microclimate conditions

Match plants to site conditions for better growth and resilience.

Combine trees, shrubs, perennials, and meadow vegetation for multifunctionality

Layered plantings deliver more ecological, social and climatic benefits.

Climate resilience

Water sensitive

Biodiversity

Healthy cities

Resource efficient

Principles of climate-adaptive planting design

Resource-efficient planting and management

- Reducing the amount of resources consumed in planting and maintenance
- Lower irrigation and maintenance demands
- Sustainable long-term management approaches

Native and ecologically adapted plant selection

- Use of native or close-to-native plant species
- Plant selection based on ecological conditions
- Strengthening local landscape identity

New York City's High Line (Oudolf, 2013)

High angle view of wetland nature park in Singapore (Rifle Range Nature Park) (NPark's, 2025)

Principles of climate-adaptive planting design

Site-responsive planting design

- Selection of plants according to existing soil conditions
- Adaptation to available watering and moisture regimes
- Drought-resilient and climate-adaptive species

Functional planting strategies

- Selection of suitable species for each function
- Reducing maintenance and care costs
- Improving usability and environmental performance

Cheonggyecheon Stream Restoration Project (Village Well, 2025)

Queen Elizabeth Olympic Park in London8 (Price, 2012)

Principles of climate-adaptive planting design

Biodiversity and habitat creation

- Increasing plant diversity and ecological resilience
- Attracting insects, birds, and animals
- Plants as shelter, food sources, and nesting materials
- Supporting urban ecosystems and pollinators

Nature experience in urban environments

- Creating natural or close-to-natural landscapes in cities
- Improving human connection with nature
- Enhancing the quality and atmosphere of urban spaces

Parc du chemin de l'île – Nanterre (Aquasylva, 2016)

Park am Gleisdreieck – Westpark (Caramaschi, 2019) 8

Nature-based solutions for heat mitigation – cool islands, shaded corridors and microclimate regulation

Cool Islands, Shaded Corridors & Microclimate Regulation

Climate change and the Urban Heat Island (UHI) effect are increasing temperatures in cities

- Main causes:
 - impervious surfaces
 - lack of vegetation
 - anthropogenic heat emissions
- Nature-Based Solutions (NbS) help to:
 - reduce urban heat
 - enhance biodiversity
 - improve human well-being

Schematic illustration of the park cool island and park breeze (Han, Q., et al. ,2023)

Nature-based solutions for heat mitigation – cool islands, shaded corridors and microclimate regulation

The Role of Trees

Trees are among the most effective urban cooling solutions:

- shading
- evapotranspiration
- wind regulation

One mature tree can release hundreds of liters of water per day, cooling the surrounding air.

Nature-based solutions for heat mitigation – cool islands, shaded corridors and microclimate regulation

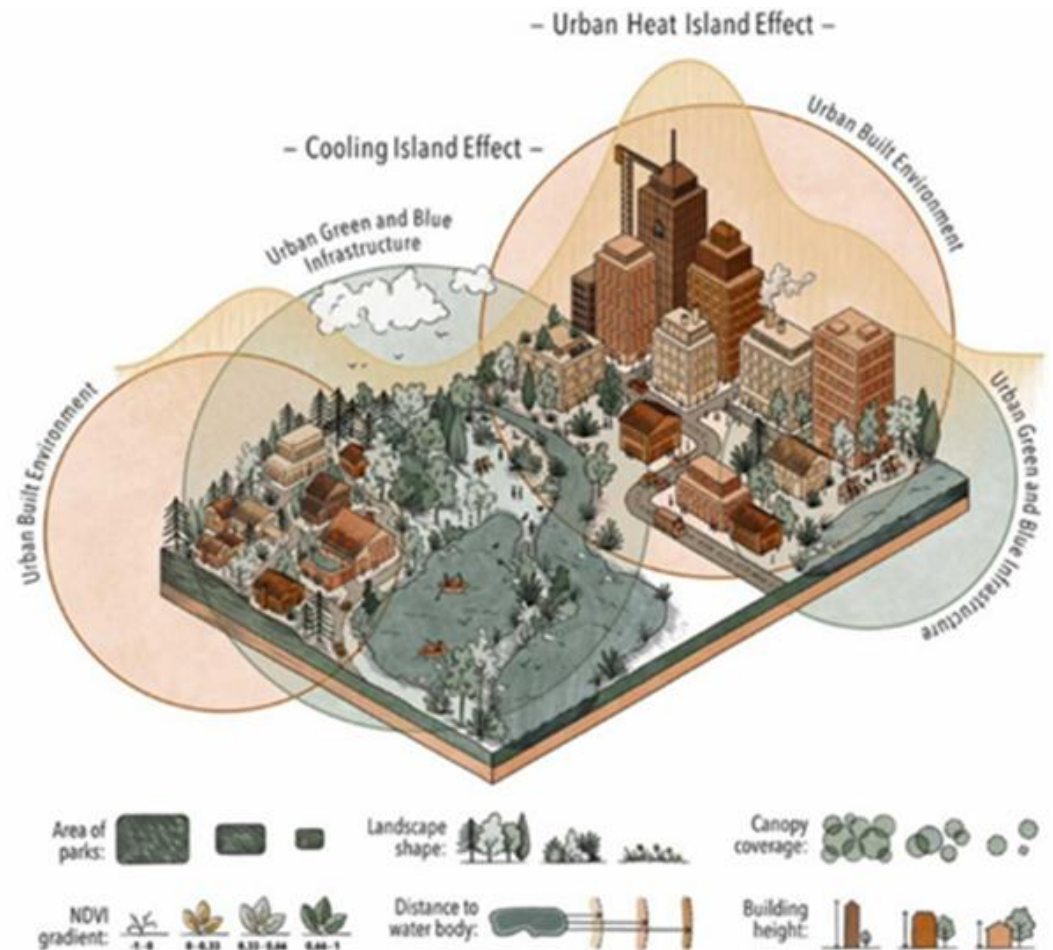

Cool Islands

Localized cooler urban areas created by:

- parks
- tree clusters
- urban meadows
- water elements

Benefits:

- reduced surface and air temperatures
- improved microclimate
- enhanced thermal comfort

Nature-based solutions for heat mitigation – cool islands, shaded corridors and microclimate regulation

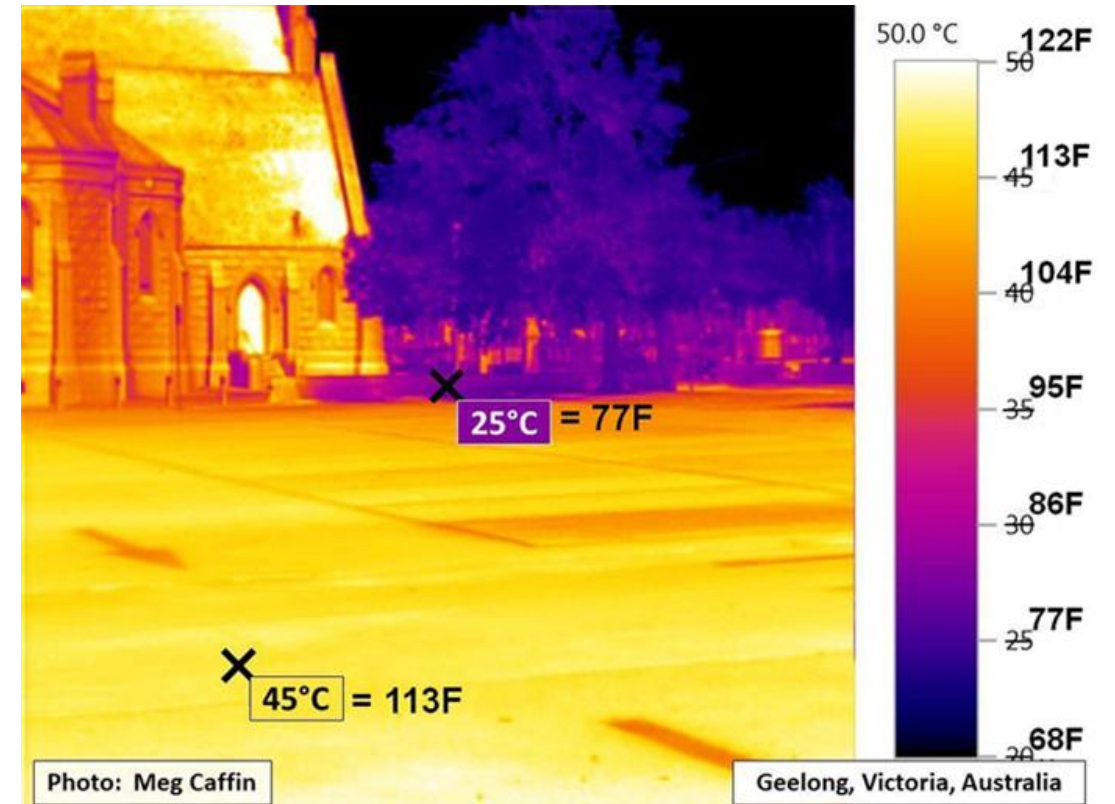

Shaded Corridors

Tree-lined streets and green corridors:

- connect cool islands
- reduce heat exposure along mobility routes
- Tree shade can reduce surface temperatures by **10–25°C**.

Additional benefits:

- improved air quality
- reduced glare
- support for walking and cycling

Temperature differences (St John, 2019)

Nature-based solutions for heat mitigation – cool islands, shaded corridors and microclimate regulation

Trees as Core Infrastructure for Climate-Resilient Cities

Trees = Urban Infrastructure

Trees should be treated as critical infrastructure, not decorative elements:

- temperature reduction
- carbon sequestration
- biodiversity support
- improved mental health

Effective NbS Planning Requires:

- connected green networks
- trees integrated into transport corridors
- climate-resilient species
- sufficient soil volume and water availability

URBAN TREES, COOLER CITIES

Pavement and concrete in cities absorb energy from the sun and then radiate that energy out, heating the air in cities more than in the surrounding countryside. Urban trees provide shade, preventing pavement and concrete from heating up, and also cool the air by transpiring water. Trees can cool neighborhoods by up to 4 degrees Fahrenheit.

Climate Tree Initiative - From Scientific Frameworks to Applied Urban Forestry Practice

Why climate-resilient trees are needed

Urban trees are increasingly affected by:

- heat waves
- drought
- late frosts
- flooding and storm events

Traditional species selection is no longer sufficient under changing climate conditions

Modern urban forestry focuses on **climate-resilient tree selection** based on long-term adaptability and stress tolerance

Main idea

Climate tree selection combines:

- scientific research
- empirical field testing
- applied nursery practice

Created by Open AI, version 5.5, 2026

Climate Tree Initiative - Scientific and Empirical Foundations

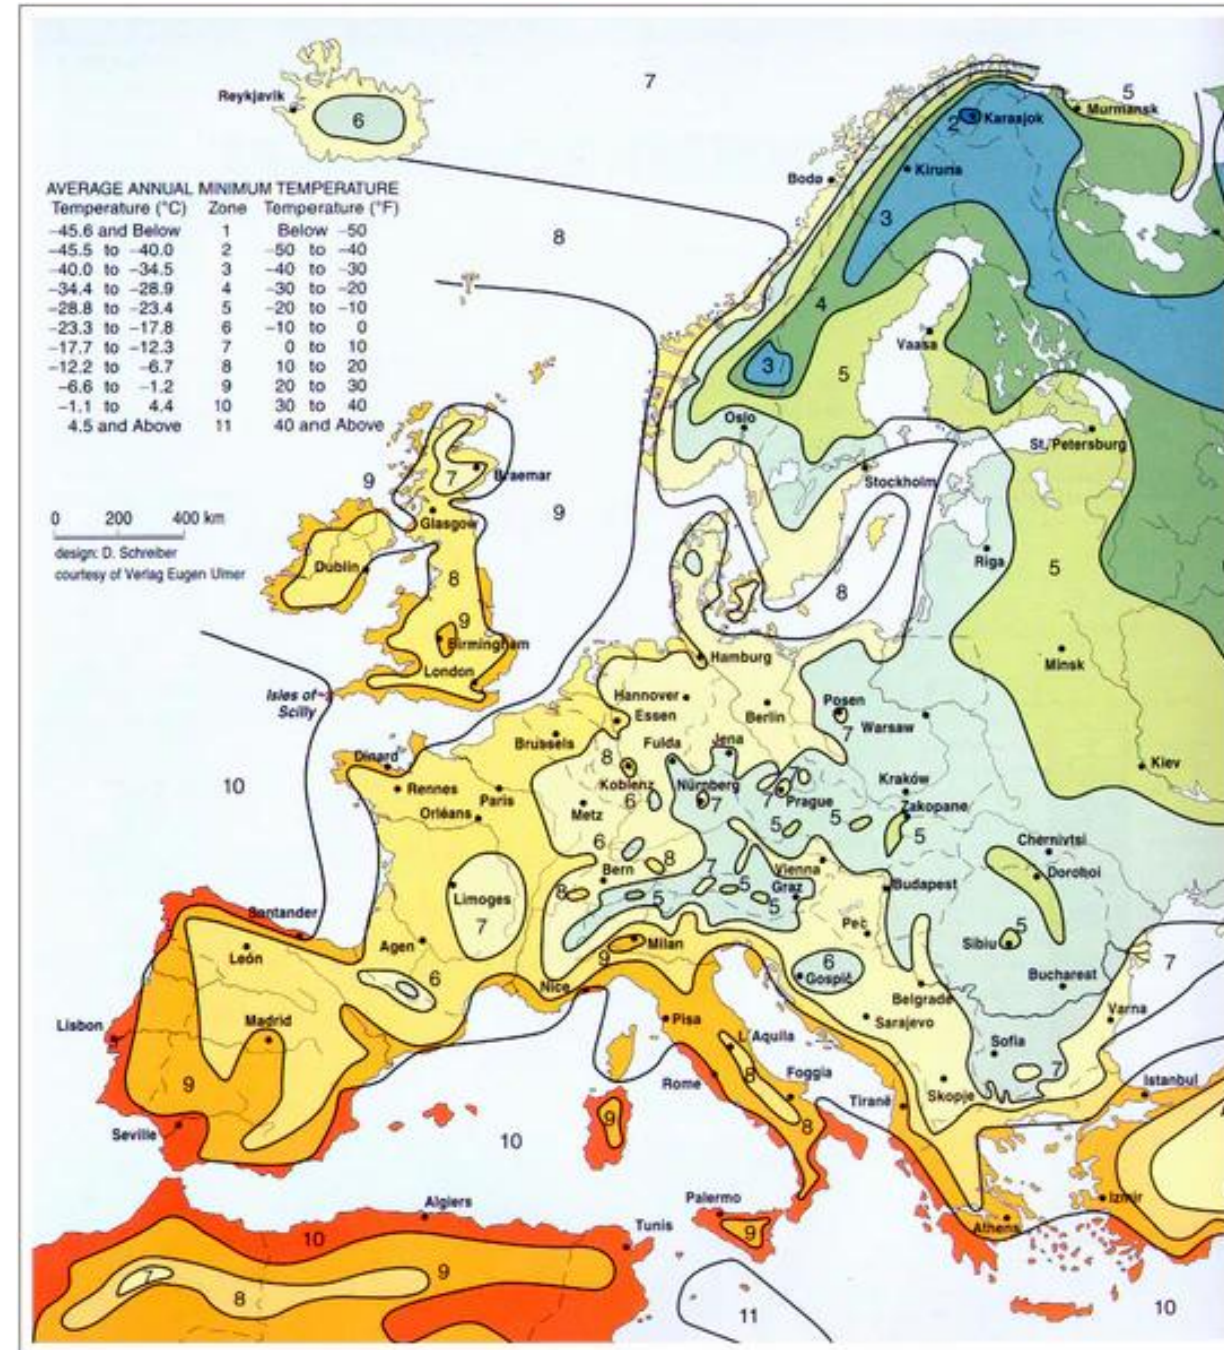

Scientific framework

Evaluates tree species according to tolerance to:

- drought
- heat
- excess moisture

Focuses on **future adaptability**, not only historical suitability

Integrates climate projections and species physiology

European hardiness zones

Climate Tree Initiative - Scientific and Empirical Foundations

GALK Street Tree Program

Long-term empirical testing in Germany

The "Urban Trees" working group conducted long-term street tree trials in several German cities under standardized urban conditions **between 1995 and 1999**.

Tree species were evaluated for growth, vitality, and suitability for urban environments.

The results formed the basis of the GALK **Street Tree List**, supporting evidence-based climate-resilient tree selection.

Botanischer und deutscher Name	Wuchshöhe in m	Breite in m	Lichtdurchlässigkeit	Lichtbedarf	Verwendbarkeit	Bemerkungen
Acer buergerianum syn. A. trifidum, Dreizahn-Ahorn, Dreispitz-Ahorn	8-10 (15)	4-6	mittel	○-☉	noch im Test	kompakte, runde Krone, locker verzweigte Äste, auf geschützten Standorten ausreichend frosthart, gebietsweise frostempfindlich, für enge Straßenbereiche geeignet, im <u>Straßenbaumtest 2</u> seit 2007/08
Acer campestre, Feldahorn, Maßholder	10-15 (20)	10-15	mittel	○-☉	geeignet mit E.	eiförmige, unregelmäßige, im Alter mehr runde Krone, verträgt trockene Böden und hohen Versiegelungsgrad, guter Bodenbefestiger für Ufer bzw. Hanglagen, Bienenweide
Acer campestre 'Elsrijk', Feldahorn	6-12 (15)	4-6	mittel	○-☉	geeignet	wie die Art, jedoch gerader durchgehender Stamm, im Wuchs schmaler und gleichmäßiger, gebietsweise Frostschäden in der Krone, mehlaufrei, Bienenweide
Acer campestre 'Huibers Elegant' syn. A. campestre 'Elegant', Feldahorn	6-10	3-5	mittel	○-☉	noch im Test	sehr regelmäßiger, aufrechter Wuchs, gilt als mehlaufrei,
Acer monspessulanum, Französischer Ahorn, Burgen-Ahorn, Dreilappiger Ahorn	5-8 (11)	4-7 (9)	mittel	○		
Acer opalus, Schneeball-Ahorn	8-10 (20)	5-8	mittel			
Acer platanoides, Spitzahorn	20-30	15-22	gering	○		

 <p>München 2004</p> <p>Mittelstark wachsend, Austrieb dunkelrot, später vergrünend, gerader durchgehender Stamm; gebietsweise Frostschäden in der Krone sowie Rindennekrosen.</p> <p>Bewertung 2000: Trotz eines Totalausfallers und starker Frostschäden wird der Baum als bedingt geeignet eingestuft, weil zwei Städte Bestnoten ergeben haben.</p> <p>Bewertung 2005: bedingt geeignet</p> <p>Bewertung 2015: Kegel- bis eiförmige Krone, Äste aufrecht wachsend. Regional in unterschiedlichem Maße Trockenschäden, vereinzelt auch Frostschäden, dadurch erhöhter Schnittaufwand. Mittlere bis gute Gesamtentwicklung.</p> <p>Geeignet mit Einschränkungen</p>	 <p>Hannover 2004</p> <p>Straff aufrechter, kräftiger und gleichmäßiger Wuchs, Krone im Alter zu rundlich tendierend; wenig mehlaufanfällig; gebietsweise Rindennekrosen.</p> <p>Bewertung 2000: Bessere Beurteilung als 'Deborah', allerdings gibt es auch hier erhebliche Frostschäden und von keiner Stadt eine Bestnote, so dass auch hier nur die Beurteilung bedingt geeignet ausgesprochen wird.</p> <p>Bewertung 2005: bedingt geeignet</p> <p>Bewertung 2015: Kegel- bis eiförmige Krone, Äste überwiegend aufrecht wachsend. Regional in unterschiedlichem Maße Trockenschäden, vereinzelt auch Blatt- und Frostschäden, dadurch erhöhter Schnittaufwand. Mittlere bis gute Gesamtwirkung.</p> <p>Geeignet mit Einschränkungen</p>	 <p>Hannover 2004</p> <p>Sehr raschwüchsig Baum mit breit pyramidalen Krone, Äste locker aufrecht, im Alter mehr waagrecht ausgebreitet, gerader durchgehender Stamm, lang haftende, dunkelgrüne, leicht glänzende Belaubung (Schneebruchgefahr).</p> <p>Bewertung 2000: Dieser Baum wird gut bis sehr gut bewertet, nur in München ist ein Totalversagen zu beklagen, so dass leider nur ein 'geeignet' festgelegt werden kann.</p> <p>Bewertung 2005: gut geeignet</p> <p>Bewertung 2015: Kegel- bis eiförmige Krone, Äste aufrecht bis überhängend wachsend. Starkes Wachstum, vital, starker Fruchtbehang. Gute bis sehr gute Gesamtentwicklung.</p> <p>Gut geeignet</p>

Climate Tree Initiative - Applied Practice and Selection Criteria

Nursery-based testing and climate tree catalogs

Long-term testing under urban stress conditions:

- drought
- heat exposure
- compacted soils
- restricted root zones

Climate tree catalogs combine:

- scientific research
- empirical trial data
- horticultural expertise

Selection criteria

Climate-resilient trees are evaluated by:

- drought and heat tolerance
- flood tolerance
- resistance to urban stress
- ability to grow in compacted soils
- long-term vitality and stability

Acer campestre i.S. – Feld-Ahorn

Herkunft: Mitteleuropa
Höhe: 6 bis 10 m; Breite: 4 bis 8 m
Wuchs: Kleinbaum, unregelmäßig breit-eiförmig bis runde Krone
Blüte: gelbgrüne Trugdolden, April/Mai
Wurzel: Herzwurzel
Sorten: 'Elegant', 'Etrik', 'Fastigiata'
Hinweis: mehrlauesistente Sorten erhältlich

Acer rubrum – Rot-Ahorn

Herkunft: Östliches Nordamerika
Höhe: 10 bis 15 m; Breite: 4 bis 7 m
Wuchs: mittelgroßer Baum, breit kegelförmige bis runde Krone
Blüte: auffallend, rote Blütenbüschel, März-April
Wurzel: Flachwurzel
Sorten: 'Red Sunset', 'October Glory'

Acer monspessulanum – Französischer Ahorn

Herkunft: Mitteleuropa
Höhe: 6 bis 10 m; Breite: 4 bis 8 m
Wuchs: Kleinbaum, unregelmäßig breit-eiförmig bis runde Krone
Blüte: gelbgrüne Trugdolden, April/Mai
Wurzel: Herzwurzel
Hinweis: sehr gesund, wärmeliebend, rechtzeitig Verfügbarkeit prüfen

Alnus spaethii – Purpur-Erle

Herkunft: Züchtung (A. japonica x A. subcordata)
Höhe: 12 bis 15 m; Breite: 6 bis 8 m
Wuchs: mittelgroßer Baum, breit kegelförmige Krone
Blüte: rötlichgelbe Kätzchen, (Feb.) März
Wurzel: Flachwurzel
Hinweis: sehr robust und wärmeverträglich, schöne Herbstfärbung

The Climate–Species Matrix (Roloff et al., 2009)

ACER CAMPESTRE
Field Maple

0 ● ● ● ● 5x

Details tree: Scandinavia
Height: 10-12 m
Width: 4-6 m
Foliage: mostly to central
Leaves: dark green, also reddish-orange
Flowers: yellow, green, purple
Fruit: winged fruit, brown
Bark: smooth, grey, fissured
Note: suitable for open locations, provides shade and winter protection

VALUATION:
Lorberg: ★★★★★
GALK: suitable with limitations
Climate type: Mainz: 1.1

ACER PLATANOIDES
Norway Maple

0 ● ● ● ● 4

Large tree: Scandinavia
Height: 18-25 m
Width: 10-12 m
Foliage: mostly upright, central
Leaves: 3-lobed, dark green, also dark green, lighter autumn
Flowers: yellow, green, purple
Fruit: winged fruit, brown
Bark: smooth, grey, fissured
Note: suitable for open locations, provides shade and winter protection

VALUATION:
Lorberg: ★★★★★
GALK: suitable with limitations
Climate type: Mainz: 2.1

EXAMPLES FROM PRACTICE

Climate-adaptive planting in urban environments

**BAUMSCHULE
KULTURFORUM**

Berlin, Germany
2023

AM TACHELES

Berlin, Germany
2016–2023

**HUMBOLDT
FORUM**

Berlin, Germany
2020–2023

**RUMMELSBURG
& UBER ARENA**

Berlin, Germany
ongoing

**GÄRTEN DER WELT
& TREETRAIN**

Berlin, Germany
2016–2019

BUCKOWER FELDER

Berlin, Germany
2020–2021

Baumschule Kulturforum

Berlin, Germany | 2023

atelier le balto + Klaus Biesenbach

Main idea

Temporary experimental urban forest installation transforming hard urban surfaces into flexible green public space.

Climate-adaptive solutions

- Mobile tree islands in containers
- Heat reduction and shading
- Combination of native + climate-resilient species
- Biodiversity support
- Flexible and temporary planting system

Spatial / social impact

- Creates new public gathering spaces
- Improves microclimate in highly sealed area
- Introduces “temporary urban nature”
- Trees later replanted elsewhere in the city

Lessons for Baltic cities

- Experimental and mobile planting systems could help test future climate tree species before permanent implementation.

Am Tacheles

Berlin, Germany | 2016–2023

Herzog & de Meuron + Latz + Partner

Main idea

- Mixed-use urban quarter where landscape architecture creates identity through species-based spatial organisation.

Climate-adaptive solutions

- One tree species for each urban space
- Permeable paving systems
- Green roofs and vertical greening
- Shaded urban courtyards
- Integrated BFF ecological system

Spatial / social impact

- Strong spatial identity
- Improved pedestrian comfort
- Seasonal biodiversity support
- Flexible multifunctional public spaces

Lessons for Baltic cities

- Simple and readable planting structure can strengthen urban identity while integrating ecological functions.

Humboldt Forum

Berlin, Germany | 2020–2023

bbz landschaftsarchitekten

Main idea

- Educational landscape concept inspired by Alexander von Humboldt's global botanical explorations.

Climate-adaptive solutions

- Plant collections from different climate zones
- Seasonal and ecological diversity
- Educational integration in landscape
- Shade and microclimate improvement
- Biodiversity support in dense urban setting

Spatial / social impact

- Interactive and educational public space
- Cultural identity through vegetation
- Improved environmental comfort
- Social gathering and resting spaces

Lessons for Baltic cities

- Botanical collections can become both educational tools and experimental climate adaptation landscapes.

Rummelsburg & Uber Arena Berlin, Germany | ongoing redevelopment

Main idea

- Dense urban redevelopment integrating green infrastructure into highly sealed public spaces.

Climate-adaptive solutions

- Linear tree corridors
- Raised planting beds
- Surface stormwater systems
- Permeable pavement integration
- Soil protection strategies

Spatial / social impact

- Improved pedestrian comfort
- Reduced urban heat island effect
- Visible water management processes
- Flexible and robust public spaces

Lessons for Baltic cities

- Even highly urbanized districts can integrate climate-adaptive greenery through strategic linear systems.

Gärten der Welt & TreeDrain

Berlin, Germany | 2016–2019

TU Berlin + Sieker

Main idea

- Integration of urban trees and decentralized stormwater management into multifunctional infrastructure.

Climate-adaptive solutions

- Baum-Rigolen systems
- Stormwater infiltration + storage
- Water supply for trees
- Pollutant filtration
- Urban cooling through evapotranspiration
- **Spatial / social impact**
- Reduced flooding risk
- Improved tree vitality
- Better urban water balance
- Multifunctional green-grey infrastructure

Lessons for Baltic cities

- TreeDrain systems offer strong potential for climate-resilient street reconstruction and water-sensitive planning.

Buckower Felder

Berlin, Germany | 2020–2021

Prof. Dr. Sieker mbH

Main idea

- Large-scale ecological residential landscape integrating planting and stormwater infrastructure.

Climate-adaptive solutions

- Distributed green infrastructure
- Multifunctional retention landscapes
- Meadow-like extensive planting
- Baumrigolen systems
- Emergency water pathways

Spatial / social impact

- Flood adaptation
- Biodiversity enhancement
- Cooler residential environment
- Ecological urban identity

Lessons for Baltic cities

- Climate-adaptive planting should function as infrastructure, not only decoration.
